

Life at the Seashore

The seashore is a habitat where the ocean meets the land. It is a place where the changing water levels caused by the tides alternately cover it in ocean water and expose it high and dry to the air. Many fascinating and very different kinds of organisms make the seashore their home and survive very well here. These organisms are able to find food, reproduce, and protect themselves from the changing tides and crashing waves.

Unit Overview

In this Unit, students examine how living things survive at the seashore. Students take a look at what kind of place the seashore is and make observations on the kinds of structures organisms have that help them survive there, including structures that help them move, feed and protect themselves. They deepen their understanding of how a group of animals called Crustaceans survive and find food at the seashore, with investigations on a crayfish. As they build a 3-dimensional seashore in their classroom, students research an organism and present predictions for where on the seashore their animal would survive and grow. They create a Field Trip Guide to share their understanding of the seashore with visitors coming to observe their classroom seashore.

The Unit is built on three multi-session activities:

Investigation 1: Seashore Charades

In this engaging activity, students discuss what they would need and what they might expect to see on a field trip to the seashore, then embark on a virtual field trip. They learn what kind of place the seashore is and observe important conditions such as waves and changing tides. Students think about and discuss what an animal or seaweed living there would need or how it might behave to help it survive. The teacher adds to their ideas as s/he provides descriptive and interesting information about some common animals and seaweeds living at the seashore. S/he then guides small groups of students as they communicate this new information to the class through charades that demonstrate different body structures and behaviors used by seashore organisms. Students discover that organisms living here have different body parts, or structures, and behaviors, that help them sense their environment, find and take in food, protect themselves from predators, and have their young. Students learn and demonstrate their understanding that these structures are related to their function.

Investigation 2: Crayfish Capers

Students investigate a member of one of the most successful groups of animals in the world, the Arthropods. This group includes insects, spiders, and crustaceans such as lobsters, crabs, shrimp, beach hoppers, barnacles and crayfish. To build their understanding of how living things survive at the seashore, students observe and investigate a crustacean called a crayfish. Most crustaceans live in the ocean; however crayfish live in freshwater and thus are relatively easy to keep in the classroom. To learn more about how these organisms survive, students observe the external body parts of the crayfish and ask questions about how these organisms sense their environment. The students design and conduct an investigation to answer a question about how crayfish find and sense their food. They analyze data from another student investigation and make a claim about the structure(s) crayfish use to sense their food. Finally, students write and make labeled drawings to communicate what they have learned about crayfish.

Investigation 3: Build a Seashore

At first glance, the seashore habitat, much like a human city, seems busy and too big to navigate. When we notice a pattern, like recognizing neighborhoods, we can observe how the habitat is organized and attempt to explain how living things survive and grow there. One dominant pattern, found at most seashores in the world, are the bands, or **zones**, in which characteristic seaweeds and animals can be found. The crashing waves and rise and fall of the tides may present challenges to survival there, but the advantages include an environment rich with food, and plentiful shelter from both land and ocean predators. The zones describe the position on the shore in relation to the tides, ranging from zones exposed to air only at the lowest of tides, to zones that are rarely underwater and only splashed by waves at high tides. Body structures and behaviors provide organisms with the means to survive in these intertidal zones, such as conserving water so they can continue to breathe and maintain a cool temperature until the high tide returns. In this activity, students research an organism and present their prediction for where on the seashore the animal would survive and grow. They build a three dimensional (3-D) seashore in their classroom, to help them better understand the distribution of the organisms living there and create a Field Trip Guide

Life at the Seashore for Grade 1 (Draft).

to share their understanding of the seashore with visitors coming to observe their classroom seashore.

Standards Correlations

The Next Generation Science Standards (NGSS) ask 1st grade students to develop an understanding of how plants and animals use their external parts to help them survive and grow and meet their needs as well as how behaviors of parents and offspring help the offspring survive. The unit provides a curriculum that aligns with all the first grade life science disciplinary core ideas, (LS1.A; LS1.B; LS1.D; LS3.A partially; and, LS3.B). The cross cutting concepts of patterns and structure and function are called out in this Unit as organizing concepts for these disciplinary core ideas. NGSS also asks students to demonstrate grade-appropriate efficiency in science and engineering practices that deepen their understanding of science ideas and how science works. In this Unit, students plan and carrying out investigations, analyze and interpret data, construct explanations and design solutions, and obtain, evaluate, and communicate information to better understand life at the seashore.

The Unit also correlates with connected 1st grade Common Core State Standards in English language Arts & Literacy in History/Social Studies, Science, and Technical Subjects (CCSS ELA) and Common Core State Standards for Mathematics (CCSS Math), and the Ocean Literacy Principles.

Ocean Literacy Principles

- There is a greater diversity of organisms in the ocean than are found on land (K-2 S&S 5A; OLP 5a, c, d).
- The variety of different structures and behaviors that marine organisms have to help them survive (K-2 S&S 5A.4) provide unique and important examples for understanding structure and function (DCI LS1.A), growth and development of organisms (DCI LS1.B), and how organisms process information for growth and survival (DCI LS1.C).
