

## **Explanations for the instructor: how to use the various handouts in the Using Environmental Data activity**

### 1. Using Environmental Data to investigate ocean acidification worksheet\_blank

This is the worksheet for participants to use if they don't have access to a computer to do the online piece in the classroom - there are no answers included, but the graphs are already downloaded for them and are part of the worksheet. Hopefully, you won't need to use this version because it is great for the participants to access the online data themselves, rather than get the completed graph.

### 2. Using Environmental Data to investigate ocean acidification worksheet\_blank\_no images

This is the worksheet for participants to use if they can access the online data repository and make their own graphs. There are no answers included in this version, but also no images of the graphs we want them to make themselves. This would be the version we hope they will use.

### 3. Using Environmental Data to investigate ocean acidification worksheet\_answers. This is the answer key for the instructor.

### 4. Graphs folder - these might be useful for an instructor if students don't have access to online during class, but perhaps the instructor would want to give the participants the graphs separately from the worksheet.
